Flow Restrictors

Flow Restrictors

A flow restrictor is a device with no moving parts which simply restricts the flow in order to ensure that a UV system is not exceeding it's flow rating. Sterilight™ UV systems are designed to deliver a **specific UV dose** at a specific flow rate therefore flow rate is very important.

VIQUA offers a wide variety of flow restrictors manufactured from both brass and stainless steel with each model being controlled by an orifice that is inserted in the body of the flow restrictor.
